COPYRIGHT STATEMENT

The copyright law of the United States (Title 17, United States Code) governs the making of photocopies or other reproductions of copyrighted materials including foreign works under certain conditions. In addition, the United States extends protection to foreign works by means of various international conventions, bilateral agreements, and proclamations.

Under certain conditions specified in the law, libraries and archives are authorized to furnish a photocopy or other reproduction. One of these specified conditions is that the photocopy or reproduction is not to be "used for any purpose other than private study, scholarship, or research." If a user makes a request for, or later uses, a photocopy or reproduction for purposes in excess of "fair use," that user may be liable for copyright infringement.

The Columbia University Libraries reserve the right to refuse to accept a copying order if, in its judgement, fulfillment of the order would involve violation of the copyright law.

COTTON PRODUCTION IN MISSOURI, 1928-1937

- By Counties -

Acreage planted to cotton in Missouri during the past 10 years has varied from 319,000 acres in 1934 to 569,000 acres in 1937. The small acreage in 1934 resulted in a large part from the acreage reductions under contract with the Agricultural Adjustment Administration. Approximately 113,000 acres of cotton were plowed up under the terms of the first cotton program in 1933.

Yield per acre during the past 10-year period has varied from 199 pounds in 1930 to 390 pounds in 1931. Except for the 3 years 1928, 1930, and 1935, the yields have been fairly uniform, averaging about 350 pounds. The low yields of 1928 were caused by an unfavorable growing season. Rainfall was much above normal and temperatures cooler than average. The drought of 1930 caused the low average yields for that year. Rainfall for the growing season was about one half of normal. In 1935 rainfall was much above average in the spring and early summer with cooler than average temperatures.

The production is expressed in terms of 500-pound equivalent gross weight bales and has varied from 150,000 bales in 1928 to 404,000 bales in 1937. The record large acreage planted to cotton in 1937, coupled with above average yields, resulted in a record production.

The estimates of production are based upon the ginnings within each county as reported to the United States Bureau of the Census with adjustments for cross-county movement of seed cotton.

The estimates of cotton planted are based upon the United States Censuses of 1925, 1930, and 1935, the Missouri Farm Census for each year of the period except 1934, data available from the Agricultural Adjustment Administration for the years 1933 to 1937, inclusive, and current reports from crop reporters relating to cotton production each year.

The estimates of yield per acre are based upon yields computed from acres and bales reported to the Bureau of the Census in census years and upon current reports from crop reporters relating to yield in each year.

The estimates of acreage planted and of yield per acre are reconciled with the estimates of production in such manner as to give a consistent series of estimates of acreage and of yield per acre.

Alfred C. Brittain
Agricultural Statistician
